BACKGROUND

Breast cancer rates among Asian women are relatively low compared with Western populations; however, rates have increased in recent years (1-2). Few studies have characterized clinical-pathological features and molecular subtypes in Asian breast cancer patients, although substantial variation in occurrence among Asian subpopulations has been reported (2). Here, we report clinical factors, pathology, and molecular profiles of Chinese patients enrolled in the US and Hong Kong, HKSAR, and from randomly selected and age-matched Caucasian (Cau) and African-American (AA) patients.

STUDY POPULATION AND METHODS

This analysis included Chinese patients enrolled in the United States (n=24) and Hong Kong (n=42) with early stage, invasive breast cancer for whom clinical characteristics were captured with informed consent, enrolled between 2012 and 2018 (NCT02669745). For ethnicity comparisons, randomly selected Cau (n=100) and AA (n=100) were included from the prospective, US-based FLEX registry (NCT03053193).

Because Chinese patients were significantly younger than Cau and AA patients, age-matched Cau (n=132) and AA (n=33) patients were included for comparison. Ethnicity was patient reported. Clinical characteristics, pathology, and results from the 70-gene (70-GS, MammaPrint) risk of recurrence and 80-gene (80-GS, BluePrint) molecular subtyping signatures were compared. Student *t* test and Chi squared test were used for comparisons.

Hong Kong vs. US Chinese Patients

Between US- and Hong Kong Chinese patients, grade (p=0.0001) and nodal status (p=0.002) were significantly different. BluePrint subtyping distribution was approaching significance (p=0.081) between these groups.

CONCLUSIONS

- The current study revealed disparities in clinical and molecular features of breast tumors between Chinese American and Hong Kong patients, and among Chinese, Cau, and AA patients.
- Compared with Caucasian patients, Chinese breast cancer patients were significantly younger, more likely to be pre/peri-menopausal, had a greater frequency of high grade and HER2-type tumors, and fewer Luminal A-type tumors.
- Chinese patients were also significantly younger than AA patients, although high grade and Basaltype tumors were more frequent in AA patients.
- Compared with Hong Kong patients, Chinese American patients had greater frequency of grade 3 tumors and lymph node involvement. HER2type tumors were also more prevalent, although not statistically significant.
- Although the sample size is small, these results are consistent with other reports of younger age and greater prevalence of HER2-type tumors in Asian breast cancer patients, compared with those of European ancestry (2-5). These findings suggest a possible interaction between genetics and lifestyle factors, and perhaps influenced by immigration.
- Further study is needed to validate these trends, and future studies of breast cancer in ethnic subpopulations should incorporate evaluation of genomic profiling.
